Summer 1 2021

Module 2 Assignment

In my assignment, I have displayed a model that looks at the aspects of a doggy daycare. I have included the options for daycare or boarding, depending on the client needs. After they select that criteria, during their visit, the pet owner could choose to enroll their pet in other services. These services are specialized in the diagram and include grooming, training, and agility classes. The owner, pet, and services relationships are aggregated together based on the relationship they all have with pet_owner. The owner and pet boxes are many to one with the service box due to the owner only being able to select one service per visit and the pet only being able to get one service per visit.
